

SPARQL - Query Language for RDF

Fulvio Corno, Laura Farinetti
Politecnico di Torino
Dipartimento di Automatica e Informatica
e-Lite Research Group – <http://elite.polito.it>

The “new” Semantic Web vision

- To make data machine processable, we need:
 - Unambiguous names for resources (that may also bind data to real world objects): URIs
 - A common data model to access, connect, describe the resources: RDF
 - Access to that data: SPARQL
 - Define common vocabularies: RDFS, OWL, SKOS
 - Reasoning logics: OWL, Rules
- “SPARQL will make a huge difference” (Tim Berners-Lee, May 2006)

The Semantic Web timeline

SPARQL basics

SPARQL

- **Queries** are very important for distributed RDF data
 - Complex queries into the RDF data are often necessary
 - E.g.: “give me the (a,b) pair of resources, for which there is an x such that (x parent a) and (b brother x) holds” (i.e., return the uncles)
- This is the **goal** of SPARQL (Query Language for RDF)

SPARQL

- SPARQL 1.0: W3C Recommendation January 15th, 2008
- SPARQL 1.1: W3C Working Draft January 5th, 2012
- SPARQL queries RDF graphs
 - An RDF graph is a set of triples
- SPARQL can be used to express queries across diverse data sources, whether the data is stored natively as RDF or viewed as RDF via middleware

SPARQL and RDF

- It is **the triples that matter**, not the serialization
 - RDF/XML is the W3C recommendation but it not a good choice because it allows multiple ways to encode the same graph
- SPARQL uses the **Turtle syntax**, an N-Triples extension

Turtle - Terse RDF Triple Language

N-Triples $\subset$ Turtle $\subset$ N3

- A **serialization format for RDF**
- A subset of Tim Berners-Lee and Dan Connolly's Notation 3 (N3) language
 - Unlike full N3, doesn't go beyond RDF's graph model
- A superset of the minimal N-Triples format
- Turtle has **no official status** with any standards organization, but has become popular amongst Semantic Web developers as a human-friendly alternative to RDF/XML

“Triple” or “Turtle” notation

“Triple” or “Turtle” notation

```
<http://www.w3.org/People/EM/contact#me>  
<http://www.w3.org/2000/10/swap/pim/contact#fullName>  
"Eric Miller" .  
  
<http://www.w3.org/People/EM/contact#me>  
<http://www.w3.org/2000/10/swap/pim/contact#mailbox>  
<mailto:em@w3.org> .  
  
<http://www.w3.org/People/EM/contact#me>  
<http://www.w3.org/2000/10/swap/pim/contact#personalTitle>  
"Dr." .  
  
<http://www.w3.org/People/EM/contact#me>  
<http://www.w3.org/1999/02/22-rdf-syntax-ns#type>  
<http://www.w3.org/2000/10/swap/pim/contact#Person> .
```

“Triple” or “Turtle” notation (abbreviated)

```
w3people:EM#me contact:fullName "Eric Miller" .  
w3people:EM#me contact:mailbox <mailto:em@w3.org> .  
w3people:EM#me contact:personalTitle "Dr." .  
w3people:EM#me rdf:type contact:Person .
```

Turtle - Terse RDF Triple Language

- Plain text syntax for RDF
 - Based on Unicode
- Mechanisms for namespace abbreviation
- Allows grouping of triples according to subject
- Shortcuts for collections

Turtle - Terse RDF Triple Language

- Simple triple:
subject predicate object .

```
:john rdf:label "John" .
```

- Grouping triples:
subject predicate object ; predicate object ...

```
:john  
  rdf:label "John" ;  
  rdf:type ex:Person ;  
  ex:homePage http://example.org/johnspage/ .
```

Prefixes

- Mechanism for namespace abbreviation

```
@prefix abbr: <URI>
```

- Example:

```
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
```

- Default:

```
@prefix : <URI>
```

- Example:

```
@prefix : <http://example.org/myOntology#>
```

Identifiers

■ URIs: <URI>

```
http://www.w3.org/1999/02/22-rdf-syntax-ns#
```

■ Qnames (Qualified names)

□ namespace-abbrev?:localname

```
rdf:type  
dc:title  
:hasName
```

■ Literals

□ "string" (@lang)? (^^type)?

```
"John"  
"Hello"@en-GB  
"1.4"^^xsd:decimal
```

Blank nodes

■ Simple blank node:

□ [] or _:x

```
:john ex:hasFather [] .  
:john ex:hasFather _:x .
```

■ Blank node as subject:

□ [predicate object ; predicate object ...] .

```
[ ex:hasName "John" ] .  
[ ex:authorOf :lotr ;  
  ex:hasName "Tolkien" ] .
```

Blank nodes

Collections

■ (object1 ... objectn)

```
:doc1 ex:hasAuthor (:john :mary) .
```

■ Short for

```
:doc1 ex:hasAuthor  
  [ rdf:first :john;  
    rdf:rest [ rdf:first :mary;  
               rdf:rest rdf:nil ]  
  ] .
```

Example

```
@prefix rdf: http://www.w3.org/1999/02/22-rdf-syntaxns# .
@prefix dc: <http://purl.org/dc/elements/1.1/> .
@prefix : <http://example.org/#> .

<http://www.w3.org/TR/rdf-syntax-grammar>
  dc:title "RDF/XML Syntax Specification (Revised)" ;
  :editor [
    :fullName "Dave Beckett";
    :homePage <http://purl.org/net/dajobe/>
  ] .
```

RDF Triplestores

- Basically, databases for triples

- Triplestores do not only store triples, but allow to extract the “interesting” triples, via SPARQL queries

Comparison

Relational database

- Data model
 - Relational data (tables)
- Data instances
 - Records in tables
- Query support
 - SQL
- Indexing mechanisms
 - Optimized for evaluating queries as relational expressions

RDF Triplestore

- Data model
 - RDF graphs
- Data instances
 - RDF triples
- Query support
 - SPARQL
- Indexing mechanisms
 - Optimized for evaluating
 - Queries as graph patterns

SPARQL

■ Uses SQL-like syntax

Prefix mechanism to abbreviate URIs

```
PREFIX dc: <http://purl.org/dc/elements/1.1/>  
SELECT ?title  
WHERE { <http://example.org/book/book1> dc:title  
       ?title }
```

Variables to be returned

Query pattern (list of triple patterns)

FROM ————— Name of the graph

SELECT

- Variables selection
- Variables: ?string

```
?x  
?title  
?name
```

- Syntax: `SELECT var1, ..., varn`

```
SELECT ?name  
SELECT ?x, ?title
```

WHERE

- Graph patterns to match

- Set of triples

`{ (subject predicate object .)* }`

- Subject: URI, QName, Blank node, Literal, Variable
- Predicate: URI, QName, Blank node, Variable
- Object: URI, QName, Blank node, Literal, Variable

Graph patterns

- The pattern contains **unbound symbols**
- By binding the symbols (if possible), **subgraphs of the RDF graph are selected**
- If there is such a selection, the query **returns** the bound resources

Graph patterns

- E.g.: (subject, ?p, ?o)
 - ?p and ?o are “unknowns”

Graph patterns

```
SELECT ?p ?o  
WHERE {subject ?p ?o}
```

- The **triplets** in **WHERE** define the graph pattern, with ?p and ?o “unbound” symbols
- The query returns a list of **matching p,o pairs**

Example 1

```
SELECT ?cat, ?val
WHERE { ?x rdf:value ?val.
        ?x category ?cat }
```

■ Returns:

```
[["Total Members",100],["Total Members",200],...,
["Full Members",10],...]
```

Example 2

```
SELECT ?cat, ?val
WHERE { ?x rdf:value ?val.
        ?x category ?cat.
        FILTER(?val>=200). }
```

■ Returns:

```
[["Total Members",200],...]
```

Example 3

```
SELECT ?cat, ?val, ?uri
WHERE { ?x rdf:value ?val.
        ?x category ?cat.
        ?a1 contains ?x.
        ?a1 linkTo ?uri }
```

■ Returns:

```
[["Total Members",100,http://...)],...,]
```

Example 4

```
SELECT ?cat, ?val, ?uri
WHERE { ?x rdf:value ?val.
        ?x category ?cat.
        OPTIONAL ?al contains ?x.
        ?al linkTo ?uri }
```

■ Returns:

```
[["Total Members",100,http://...], ...,
["Full Members",20, ],...,]
```

Other SPARQL Features

- Limit the number of returned results
- Remove duplicates, sort them,...
- Specify several data sources (via URI-s) within the query (essentially, a merge)
- Construct a graph combining a separate pattern and the query results
- Use datatypes and/or language tags when matching a pattern

SPARQL use in practice

- **Locally**, i.e., bound to a programming environments like Jena
 - Jena is a Java framework for building Semantic Web applications; provides an environment for RDF, RDFS and OWL, SPARQL and includes a rule-based inference engine
- **Remotely**, e.g., over the network or into a database

Providing RDF on the Web

- RDF data usually resides in a **RDF database** (triplestore)
 - ...how do we 'put them out' on the web?
- **SPARQL endpoints** (SPARQL query over HTTP)
 - Direct connection to triplestore over HTTP

Example of SPARQL endpoint

OpenLink Virtuoso SPARQL Query

This query page is designed to help you test OpenLink Virtuoso SPARQL protocol endpoint.
Consult the [Virtuoso Wiki page](#) describing the service or the [Online Virtuoso Documentation](#) section [RDF Database and SPARQL](#).

There is also a rich Web based user interface with sample queries. Visit [/isparql](#).

The screenshot shows the OpenLink Virtuoso SPARQL Query interface. A red box labeled "Dataset" points to the "Default Graph URI" field, which contains the value "http://www.w3.org/People/Berners-Lee/card". Another red box labeled "SPARQL query" points to the "Query text" field, which contains the following SPARQL query:

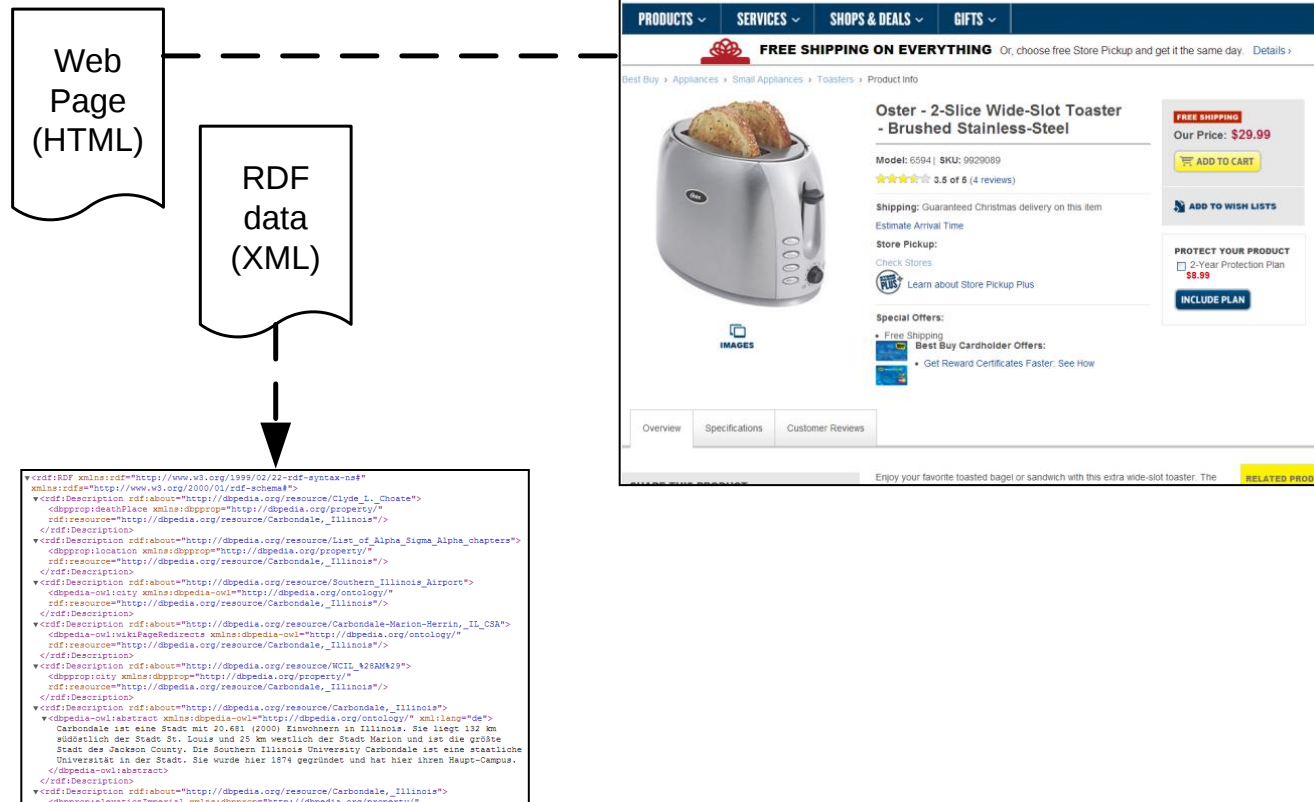

```
SELECT ?name
WHERE {
  ?person foaf:name ?name .
}
```

At the bottom of the interface, there is a "Display Results As:" dropdown menu set to "HTML", a checkbox for "Rigorous check of the query" which is checked, and two buttons: "Run Query" and "Reset". The "Run Query" button is highlighted with a red box.

Providing RDF on the Web

- Problem: usually HTML content and RDF data are separate

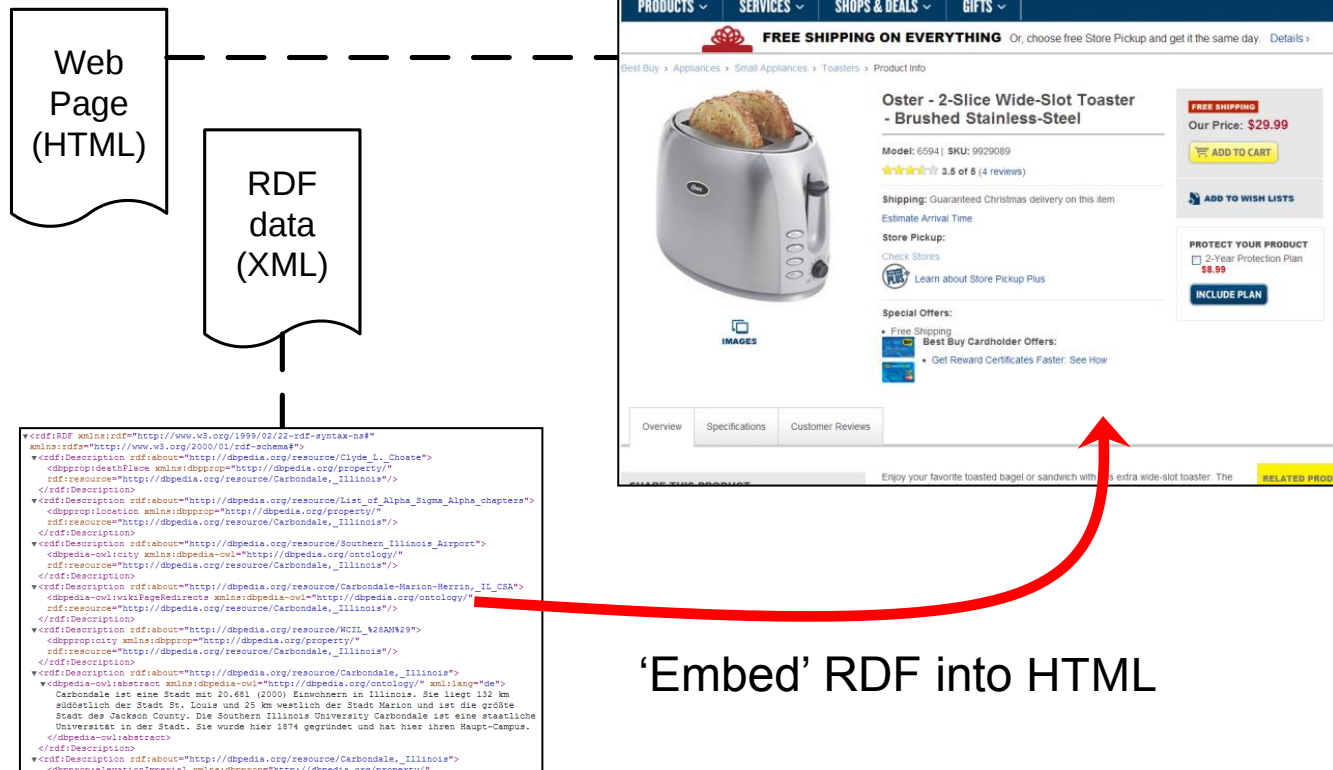

Exposing RDF on the web

- **Separate** HTML content and RDF data
- **Maintenance problem**
 - Both need to be managed separately
 - RDF content and web content have much **overlap** (redundancy)
 - RDF/XML **difficult to author**: extra overhead
- **Verification problem**
 - How to differences as content changes?
- **Visibility problem**
 - **Easy to ignore** the RDF content (out of sight, out of mind)

Exposing RDF on the web

- Solution: embed RDF into web content using RDFa

RDFa

- W3C Recommendation (October, 2008)
- Set of extensions to XHTML that allows to annotate XHTML markup with semantics
- Uses attributes from XHTML meta and link elements, and generalizes them so that they are usable on all elements
- A simple mapping is defined so that RDF triples may be extracted

Exposing RDF on the web

- RDFa: Resource Description Framework-in-attributes

The screenshot shows the Best Buy website interface. The product is an "Oster - 2-Slice Wide-Slot Toaster - Brushed Stainless-Steel". The price is listed as \$29.99. Overlaid on the page is a code block containing RDFa markup. Several parts of the code are circled in green to highlight key features: the `rel="gr:hasPriceSpecification"` attribute on the `div` tag, the `class="saletext"` attribute, the `gr:UnitPriceSpecification` type, the `about="#UnitPriceSpecification_9929089_sale"` attribute, and the `property` attributes on the `span` elements, including `gr:hasCurrencyValue`, `gr:hasCurrency`, `gr:hasUnitOfMeasurement`, and `gr:valueAddedTaxIncluded`.

```
<div id="saleprice" rel="gr:hasPriceSpecification">
  <div class="saletext">
    Our Price:</div>
    <div class="salenum"
      typeof="
        gr:UnitPriceSpecification"
      about="#UnitPriceSpecification_9929089_sale">
      <!-- B:0LI -->
      <span class="price">$29.99</span>
      <span property="gr:hasCurrencyValue" datatype="xsd:float" content="29.99"></span>
      <span property="gr:hasCurrency" datatype="xsd:string" content="USD"></span>
      <span property="gr:hasUnitOfMeasurement" datatype="xsd:string" content="C62"></span>
      <span property="gr:valueAddedTaxIncluded" datatype="xsd:boolean" content="true"></span>
      <!-- E:0LI -->
    </div>
  </div>
```

- Extra (RDFa) markup is ignored by web browsers

XHTML + RDFa example

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML+RDFa 1.0//EN"
  "http://www.w3.org/MarkUp/DTD/xhtml-rdfa-1.dtd">
<html xmlns="http://www.w3.org/1999/xhtml"
  xmlns:foaf="http://xmlns.com/foaf/0.1/"
  xmlns:dc="http://purl.org/dc/elements/1.1/"
  version="XHTML+RDFa 1.0" xml:lang="en">
  <head>
    <title>John's Home Page</title>
    <base href="http://example.org/john-d/" />
    <meta property="dc:creator" content="Jonathan Doe" />
  </head>
  <body>
    <h1>John's Home Page</h1>
    <p>My name is <span property="foaf:nick">John D</span> and I like
      <a href="http://www.neubauten.org/" rel="foaf:interest"
        xml:lang="de">Einstürzende Neubauten</a>. </p>
    <p>My <span rel="foaf:interest" resource="urn:ISBN:0752820907">
      favorite book</span> is the inspiring
      <span about="urn:ISBN:0752820907"><cite property="dc:title">
        Weaving the Web</cite> by <span property="dc:creator">Tim
        Berners-Lee</span></span> </p>
  </body>
</html>
```

Automatic conversion to RDF/XML

```
<?xml version="1.0" encoding="UTF-8"?>
<rdf:RDF xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:foaf="http://xmlns.com/foaf/0.1/"
  xmlns:dc="http://purl.org/dc/elements/1.1/">
  <rdf:Description rdf:about="http://example.org/john-d/">
    <dc:creator xml:lang="en">Jonathan Doe</dc:creator>
    <foaf:nick xml:lang="en">John D</foaf:nick>
    <foaf:interest rdf:resource="http://www.neubauten.org/" />
    <foaf:interest>
      <rdf:Description rdf:about="urn:ISBN:0752820907">
        <dc:creator xml:lang="en">Tim Berners-Lee</dc:creator>
        <dc:title xml:lang="en">Weaving the Web</dc:title>
      </rdf:Description>
    </foaf:interest>
  </rdf:Description>
</rdf:RDF>
```

RDFa annotations

- Less than 5% of web pages have RDFa annotations (Google, 2010)
- However, many organizations already publish or consume RDFa
 - Google, Yahoo
 - Facebook, MySpace, LinkedIn
 - Best Buy, Tesco, O'Reilly
 - SlideShare, Digg
 - WhiteHouse.gov, Library of Congress, UK government
 - Newsweek, BBC

RDFa is not the only solution ...

Source: Peter Mika (Yahoo!), RDFa, 2011

Rich snippets

- Several solutions for embedding semantic data in Web
- Three syntaxes known (by Google) as “rich snippets”
 - Microformats
 - RDFa
 - HTML microdata
- All three are supported by Google, while microdata is the “recommended” syntax

First came microformats

- Microformats emerged around 2005
- Some key principles
 - Start by solving **simple**, specific problems
 - Design for **humans** first, machines second
- Wide deployment
 - Used on billions of Web pages
- **Formats exist** for marking up atom feeds, calendars, addresses and contact info, geo-location, multimedia, news, products, recipes, reviews, resumes, social relationships, etc.

Then came RDFa

- RDFa aims to **bridge the gap** between human oriented HTML and machine-oriented RDF documents
- Provides **XHTML attributes** to indicate machine understandable information
- Uses the **RDF data model**, and Semantic Web vocabularies directly

RDFa example

```
<div typeof="foaf:Person"
      xmlns:foaf="http://xmlns.com/foaf/0.1/">
  <p property="foaf:name">Alice Birpemschwick</p>
  <p>Email: <a rel="foaf:mbox"
    href="mailto:alice@example.com">alice@example.com</a>
</p>
  <p>Phone: <a rel="foaf:phone" href="tel:+1-617-555-7332">
    +1 617.555.7332</a>
</p>
</div>
```

Last but not least, microdata

- Microdata syntax is based on nested groups of **name-value pairs**
- HTML microdata specification includes
 - An unambiguous **parsing model**
 - An **algorithm** to convert microdata to RDF
- Compatible with the Semantic Web via mappings

Microdata syntax

■ Microdata **properties**

- Annotate an item with text-valued properties using the “itemprop” attribute

```
<div itemscope>  
  <p>My name is <span itemprop="name">Daniel</span>.</p>  
</div>
```

Microdata syntax

■ Multiple values are ok

- As in RDF, you can have two properties, for the same item (subject) with the same value (object)

```
<div itemscope>
  <p>Flavors in my favorite ice cream:</p>
  <ul>
    <li itemprop="flavor">Lemon sorbet</li>
    <li itemprop="flavor">Apricot sorbet</li>
  </ul>
</div>
```

Microdata syntax

■ Item types

- Correspond to classes in RDF

```
<section itemscope
    itemtype="http://example.org/animals#cat">
  <h1 itemprop="name">Hedral</h1>
  <p itemprop="desc">Hedral is a male american
    domestic shorthair, with a fluffy black fur with
    white paws and belly.</p>
  
</section>
```

Microdata syntax

■ Global IDs

- Items may be given global identifiers, which are URLs
- They may be, but do not need to be Semantic Web URIs

```
<dl itemscope
  itemtype="http://vocab.example.net/book"
  itemid="urn:isbn:0-330-34032-8">
  <dt>Title</dt>
    <dd itemprop="title">The Reality Dysfunction</dd>
  <dt>Author</dt>
    <dd itemprop="author">Peter F. Hamilton</dd>
  <dt>Publication date</dt>
    <dd><time itemprop="pubdate" datetime="1996-01-26">
      26 January 1996</time></dd>
</dl>
```

Schema.org

- Schema.org is one of a number of **microdata vocabularies**
 - It is a shared collection of microdata schemas for use by webmasters
- Includes a **type hierarchy**, like an RDFS schema
 - Starts with **top-level Thing** (which has four properties: name, description, url, and image) and DataType types
 - More specific types share properties with broader types; for example, a Place is a more specific type of Thing, and a TouristAttraction is a more specific type of Place
 - More specific items **inherit the properties** of their parent

Example

```
<div itemscope itemtype="http://schema.org/Movie">
  <h1 itemprop="name">Avatar</h1>
  <div itemprop="director" itemscope
    itemtype="http://schema.org/Person"> Director:
    <span itemprop="name">James Cameron</span> (born
    <span itemprop="birthDate">August 16, 1954)</span>
  </div>
  <span itemprop="genre">Science fiction</span>
  <a href=" ../movies/avatar-theatrical-trailer.html"
    itemprop="trailer">Trailer</a>
</div>
```

Current schema.org types

Schema.org full hierarchy

Thing: description, image, name, url

CreativeWork: about, accountablePerson, aggregateRating, alternativeHeadline, associatedMedia, audio, author, award, awards, comment, contentLocation, contentRating, contributor, copyrightHolder, copyrightYear, creator, dateCreated, dateModified, datePublished, discussionUrl, editor, encoding, encodings, genre, headline, inLanguage, interactionCount, isFamilyFriendly, keywords, mentions, offers, provider, publisher, publishingPrinciples, review, reviews, sourceOrganization, text, thumbnailUrl, version, video

Article: articleBody, articleSection, wordCount

BlogPosting

NewsArticle: dateline, printColumn, printEdition, printPage, printSection

ScholarlyArticle

Blog: blogPost, blogPosts

Book: bookEdition, bookFormat, illustrator, isbn, numberOfPages

Comment

ItemList: itemListElement, itemListOrder

Map

MediaObject: associatedArticle, bitrate, contentSize, contentUrl, duration, embedUrl, encodesCreativeWork, encodingFormat, expires, height, interactionCount, offers, playerType, regionsAllowed, requiresSubscription, uploadDate, width

AudioObject: transcript

ImageObject: caption, exifData, representativeOfPage, thumbnail

MusicVideoObject

VideoObject: caption, productionCompany, thumbnail, transcript, videoFrameSize, videoQuality

Movie: actor, actors, director, duration, musicBy, producer, productionCompany, trailer

<http://www.schema.org/docs/full.html>

Item examples

Thing

The most generic type of item.

Property	Expected Type	Description
Properties from <u>Thing</u>		
description	Text	A short description of the item.
image	URL	URL of an image of the item.
name	Text	The name of the item.
url	URL	URL of the item.

More specific types

- CreativeWork
- Event
- Intangible
- Organization
- Person
- Place
- Product

Thing > Product

A product is anything that is made available for sale—for example, a pair of shoes, a concert ticket, or a car.

Property	Expected Type	Description
Properties from <u>Thing</u>		
description	Text	A short description of the item.
image	URL	URL of an image of the item.
name	Text	The name of the item.
url	URL	URL of the item.
Properties from <u>Product</u>		
aggregateRating	<u>AggregateRating</u>	The overall rating, based on a collection of reviews or ratings, of the item.
brand	<u>Organization</u>	The brand of the product.
manufacturer	<u>Organization</u>	The manufacturer of the product.
model	Text	The model of the product.
offers	<u>Offer</u>	An offer to sell this item—for example, an offer to sell a product, the DVD of a movie, or tickets to an event.
productID	Text	The product identifier, such as ISBN. For example: <meta itemprop='productID' content='isbn:123-456-789'/>.
review	<u>Review</u>	A review of the item.
reviews	<u>Review</u>	Review of the item (legacy spelling; see singular form, review).

SPARQL use in practice

- Where to find **meaningful** RDF data to search?
- The Linked Data Project

The Linked Data Project

The Linked Data Project

- A fundamental prerequisite of the Semantic Web is the existence of **large amounts of meaningfully interlinked RDF data** on the Web
- “To make the Semantic Web a **reality**, it is necessary to have a **large volume of data** available on the Web in a standard, reachable and manageable format. In addition the relationships among data also need to be made available. This collection of interrelated data on the Web can also be referred to as Linked Data. Linked Data lies at the heart of the Semantic Web: **large scale** integration of, and reasoning on, data on the Web.” (W3C)

The Linked Data Project

- Linked Data is about using the Web to **connect related data** that wasn't previously linked, or using the Web to lower the barriers to linking data currently linked using other methods
- Linked Data is a set of **principles** that allows publishing, querying and browsing of RDF data, **distributed** across different servers

The Linked Data Project

- **Community effort** to make various open datasets available on the Web as RDF and to set RDF links between data items from different datasets
- The datasets are published according to the **Linked Data principles** and can therefore be crawled by Semantic Web search engines and navigated using Semantic Web browsers
- Supported by W3C
- Began early 2007
 - <http://linkeddata.org/home>

The Web of Documents

- Analogy: a global filesystem
- Designed for human consumption
- Primary objects: documents
- Links between documents (or sub-parts)
- Degree of structure in objects: fairly low
- Semantics of content and links: implicit

The Web of Linked Data

- Analogy: a global **database**
- Designed for **machines** first, humans later
- Primary objects: **things** (or descriptions of things)
- Links between things
- Degree of structure in (descriptions of) things:
high
- **Semantics** of content and links: explicit

Linked Data example

Linked Data example

Why publish Linked Data?

- Ease of discovery
- Ease of consumption
 - Standards-based data sharing
- Reduced redundancy
- Added value
 - Build ecosystems around your data/content

Linked Open Data cloud

May 2007

DBpedia

- DBpedia is a community effort to extract structured information from [Wikipedia](#) and to make this information available on the Web
- DBpedia allows to ask sophisticated queries against Wikipedia, and to link other data sets on the Web to Wikipedia data

GeoNames

- GeoNames is a **geographical database** that contains over eight million geographical names
- Available for download free of charge under a creative commons attribution license

Main contributors

- **DBLP** Computer science bibliography
 - Richard Cyganiak, Chris Bizer (FU Berlin)
- **DBpedia** Structured information from Wikipedia
 - Universität Leipzig, FU Berlin, OpenLink
- **DBtune, Jamendo** Creative Commons music repositories
 - Yves Raimond (University of London)
- **Geonames** World-wide geographical database
 - Bernard Vatant (Mondeca), Marc Wick (Geonames)
- **Musicbrainz** Music and artist database
 - Frederick Giasson, Kingsley Idehen (Zitgist)
- **Project Gutenberg** Literary works in the public domain
 - Piet Hensel, Hans Butschalowsky (FU Berlin)
- **Revyu** Community reviews about anything
 - Tom Heath, Enrico Motta (Open University)
- **RDF Book Mashup** Books from the Amazon API
 - Tobias Gauß, Chris Bizer (FU Berlin)
- **US Census Data** Statistical information about the U.S.
 - Josh Tauberer (University of Pennsylvania), OpenLink
- **World Factbook** Country statistics, compiled by CIA
 - Piet Hensel, Hans Butschalowsky (FU Berlin)

Linked Data success stories

■ BBC Music

- **Integrates** information from MusicBrainz and Wikipedia for artist/band infopages
- Information also available in RDF (in addition to web pages)
- 3rd party applications built on top of the BBC data
- BBC also contributes data back to the MusicBrainz

■ Nytimes

- Maps its **thesaurus** of 1 million entity descriptions (people, organisations, places, etc) to Dbpedia and Freebase

Linked Data shopping list

- List of sites/datasets that the “community” would like to see published as Linked Data
 - This list may form the basis for some campaign/action to **encourage** these data publishers to embrace Linked Data
- <http://linkeddata.org/linked-data-shopping-list>

The Linked Data principles (“expectations of behavior”)

- The Semantic Web isn't just about putting data on the web. It is about making links, so that a person or machine can **explore the web of data**. With linked data, when you have some of it, you can find other, related, data
- It is the **unexpected re-use of information** which is the value added by the web

(Tim Berners-Lee)

The Linked Data principles (“expectations of behavior”)

- **Unambiguous** identifiers for objects (resources)
 - Use URIs as names for things
- Use the **structure** of the web
 - Use HTTP URIs so that people can look up the names
- Make it easy to **discover** information about an object (resource)
 - When someone looks up a URI, provide useful information
- **Link** the object (resource) to related objects
 - Include links to other URIs

Link to existing vocabularies

- For describing classes (categories) and properties (relationships), try to **re-use existing vocabularies**
 - Easier to interoperate if we're talking the same language!
- Many vocabularies/ontologies out there
 - schema.org is a great place to start looking!
 - Vocab for products (Good Relations), people (FOAF), social media (SIOC), places, events, businesses, e-commerce, music, etc., you name it...
- If nothing relevant, you can create your own, but make sure you...
 - **Publish it!**
 - Reconcile (map) it to other vocabularies, if you can

Link to other datasets

■ Popular **predicates** for linking

- ☐ owl:equivalentClass
- ☐ owl:sameAs
- ☐ rdfs:seeAlso
- ☐ skos:closeMatch
- ☐ skos:exactMatch
- ☐ skos:related
- ☐ foaf:homepage
- ☐ foaf:topic
- ☐ foaf:based_near
- ☐ foaf:maker/foaf:made
- ☐ foaf:page
- ☐ foaf:primaryTopic

■ Example:

<http://dbpedia.org/resource/Canberra>

owl:sameAs

<http://rdf.freebase.com/rdf/en.canberra>

Link to other Data Sets

Linked Data – open issues

- Schema diversity & proliferation
- Quality of data is poor
- No kind of consistency is guaranteed
- Issues with reliability of data end-points
 - High down-time is not unusual
 - There is no Service Level Agreement provided
- Querying of linked data is slow
 - Data is distributed on the web
 - Even single SPARQL endpoints can be slow
 - Most end-points are experimental/research projects with no resources for quality guarantees
- Licensing issues
 - Majority of datasets carry no explicit open license

Linked Data tools

■ Tools for Publishing Linked Data

- [D2R Server](#): a tool for publishing relational databases as Linked Data
- [Triplify](#): transforms relational data into RDF/LinkedData
- [Pubby](#): a Linked Data frontend for SPARQL endpoints

■ Tools for consuming Linked Data

- [Semantic Web Browsers and Client Libraries](#)
- [Semantic Web Search Engines](#)

Pubby

- Many triple stores and other SPARQL endpoints can be accessed only by SPARQL client applications that use the SPARQL protocol
 - It cannot be accessed by the growing variety of Linked Data clients
- Pubby is designed to provide a Linked Data interface to those RDF data sources
- <http://www4.wiwiss.fu-berlin.de/pubby/>

Pubby

Linked Data browsers – Marbles

- <http://marbles.sourceforge.net>
- XHTML views of RDF data (SPARQL endpoint), caching, predicate traversal

The screenshot displays the Marbles browser interface. At the top, a text box contains the URL `http://dig.csail.mit.edu/2007/wiki/Projects.rdf#test` with an "Open" button to its right. The Marbles logo, consisting of three colored spheres (blue, orange, red) and the word "marbles", is in the top right corner. The main content area is titled "DBpedia project" and lists several RDF properties and their values, each accompanied by a blue and a green sphere icon. The properties and values are:

- `http://www.w3.org/1999/02/22-rdf-syntax-ns#type`:
 - Project
 - Open Linked Data project
- `seeAlso`:
 - <http://dbpedia.org/resource/DBpedia>
 - <http://dig.csail.mit.edu/2007/wiki/Projects.rdf>
 - <http://dig.csail.mit.edu/2007/wiki/projects.rdf>
- `name`:
 - DBpedia project
- `comment`:
 - A collection of the data from wikipedia
- `homepage`:
 - DBpedia
- `name`:
 - DBpedia project
- `http://www.w3.org/2007/ont/od#example`:
 - John Seely Brown

Below the property list is a section titled "Sources" which shows two search results:

- <http://dbpedia.org/resource/DBpedia> redirect (303), retrieved Sun, 18 Apr 2010 14:26:04 GMT (clear)
- <http://api.sindice.com/v2/search?qt=term&page=1&q=http%3A%2F%2Fdig.csail.mit.edu/2007/wiki/Projects.rdf> success (200), retrieved Sun, 18 Apr 2010 14:26:04 GMT (clear)

- <http://refinder.dbpedia.org>
- Explore & navigate relationships in a RDF graph

Linked Data browsers – gFacet

- <http://semanticweb.org/wiki/GFacet>
- Graph based visualisation & faceted filtering of RDF data

Linked Data browsers – Forest

Linked Open Data: dati aperti collegati e usabili

Linked Open Data Italia pubblica dati aperti e facilmente accessibili da persone e applicazioni. I data set a disposizione, con licenze aperte e pubblicati in modalità [LinkData](#), possono essere direttamente interrogati da qualsiasi applicazione indipendentemente da linguaggi di programmazione e tecnologie.

Stiamo lavorando per pubblicare sempre più dati in diversi settori. Pubblica amministrazione, istruzione, infrastrutture e ricerca sono solo alcuni delle potenziali aree in cui l'accesso libero ai dati può portare giovamenti e aprire nuove opportunità. Seguici su [twitter](#) e [facebook](#) per tenerti informato sui nuovi dataset pubblicati.

Come collaborare?

Usa i dati. Sperimenta e fornisci feedback facendo query sui dati o provando ad utilizzarli in mash-up e applicazioni.

Suggerisci un dataset. Conosci dei dati pubblici poco accessibili a cui vorresti avere

SPARQL syntax

SPARQL query structure

- A SPARQL query includes, in order
 - Prefix declarations, for abbreviating URIs
 - A result clause, identifying what information to return from the query
 - The query pattern, specifying what to query for in the underlying dataset
 - Query modifiers: slicing, ordering, and otherwise rearranging query results

SPARQL query structure

- A SPARQL query includes, in order

```
# prefix declarations
PREFIX foo: <http://example.com/resources/>
...
# result clause
SELECT ...
# query pattern
WHERE {
    ...
}
# query modifiers
ORDER BY ...
```

Dataset: Friend of a Friend (FOAF)

- FOAF is a standard RDF vocabulary for describing people and relationships
- Tim Berners-Lee's FOAF information available at <http://www.w3.org/People/Berners-Lee/card>

```
@prefix card: <http://www.w3.org/People/Berners-Lee/card#> .
@prefix foaf:  <http://xmlns.com/foaf/0.1/> .
card:i foaf:name "Timothy Berners-Lee" .
<http://bblfish.net/people/henry/card#me>
foaf:name "Henry Story" .
<http://www.cambridgesemantics.com/people/about/lee>
foaf:name "Lee Feigenbaum" .
card:amy foaf:name "Amy van der Hiel" .
...
```

Example 1 – simple triple pattern

- In the graph <http://www.w3.org/People/Berners-Lee/card>, find all subjects (?person) and objects (?name) linked with the foaf:name predicate.
- Then return all the values of ?name.
- In other words, find all names mentioned in Tim Berners-Lee's FOAF file

```
PREFIX foaf:  
<http://xmlns.com/foaf/0.1/>  
SELECT ?name  
WHERE {  
    ?person foaf:name ?name .  
}
```

SPARQL endpoints

- **Accept queries** and returns results via HTTP
 - Generic endpoints queries any Web-accessible RDF data
 - Specific endpoints are hardwired to query against particular datasets
- The **results of SPARQL queries** can be returned in a variety of formats:
 - XML, JSON, RDF, HTML
 - JSON (JavaScript Object Notation): lightweight computer data interchange format; text-based, human-readable format for representing simple data structures and associative arrays

SPARQL endpoints

- This query is for an arbitrary bit of RDF data (Tim Berners-Lee's FOAF file)
- => **generic endpoint** to run it
- Possible choices
 - SPARQLer - General purpose processor - sparql.org
 - <http://sparql.org/sparql.html>
 - [OpenLink's Virtuoso](http://bbc.openlinksw.com/sparql/) (Make sure to choose "Retrieve remote RDF data for all missing source graphs")
 - <http://bbc.openlinksw.com/sparql/>
 - [Redland's Rasqal](http://librdf.org/rasqal/)
 - <http://librdf.org/rasqal/>

SPARQLer

General SPARQL query : input query, set any options and press "Get Results"

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name
WHERE {
  ?person foaf:name ?name .
}
```

SPARQL query

Dataset

Target graph URI (or use FROM in the query)

Output XML: ☒ with XSLT style sheet (leave blank for none):

or JSON output: ☐

or text output: ☐

Force the accept header to text/plain regardless ☐

Get Results

OpenLink's Virtuoso

OpenLink Virtuoso SPARQL Query

This query page is designed to help you test OpenLink Virtuoso SPARQL protocol endpoint. Consult the [Virtuoso Wiki page](#) describing the service or the [Online Virtuoso Documentation](#) section [RDF Database and SPARQL](#).

There is also a rich Web based user interface with sample queries. Visit [/isparql](#).

The screenshot shows the OpenLink Virtuoso SPARQL Query interface. It includes a 'Query' section with a 'Default Graph URI' field containing 'http://www.w3.org/People/Berners-Lee/card', a dropdown menu for 'Retrieve remote RDF data for all missing source graphs', and a 'Query text' area containing a SPARQL query. A red box labeled 'Dataset' points to the URI field. Another red box labeled 'SPARQL query' points to the query text area. At the bottom, there is a 'Display Results As:' dropdown set to 'HTML', a checkbox for 'Rigorous check of the query', and 'Run Query' and 'Reset' buttons. A red box highlights the 'Run Query' button.

Query

Default Graph URI

http://www.w3.org/People/Berners-Lee/card

Retrieve remote RDF data for all missing source graphs

Query text

```
SELECT ?name
WHERE {
  ?person foaf:name ?name .
}
```

Display Results As: HTML ☒ Rigorous check of the query Run Query Reset

Example 1 - simple triple pattern

```
PREFIX foaf:
<http://xmlns.com/foaf/0.1/>
SELECT ?name
WHERE {
    ?person foaf:name ?name .
}
```

name
Dan Connolly
Henry Story
Timothy Berners-Lee
Norman Walsh
World Wide Web Consortium
Ralph R. Swick
Daniel Krech
Christoph Bussler
Nicholas Gibbins
Wendy Hall
Nigel Shadbolt
Les Carr
Charles McCathieNevile
Håkon Wium Lie
Peter Szolovits

Example 2 – multiple triple pattern

- Find all people in Tim Berners-Lee's FOAF file that have names and email addresses
- Return each person's URI, name, and email address
- Multiple triple patterns retrieve **multiple properties** about a particular resource
- **SELECT *** selects all variables mentioned in the query

```
PREFIX foaf:  
<http://xmlns.com/foaf/0.1/>  
SELECT *  
WHERE {  
    ?person foaf:name ?name .  
    ?person foaf:mbox ?email .  
}
```

Example 2 - multiple triple pattern

person	name	email
http://www.w3.org/People/Connolly/#me	Dan Connolly	mailto:connolly@w3.org
http://www.w3.org/People/Berners-Lee/card#i	Timothy Berners-Lee	mailto:timbl@w3.org
http://www.aaronsw.com/about.xrdf#aaronsw	Aaron Swartz	mailto:me@aaronsw.com
http://www.dajobe.org/foaf.rdf#i	Dave Beckett	mailto:dave@dajobe.org
http://www.w3.org/People/Berners-Lee/card#amy	Amy van der Hiel	mailto:amy@w3.org
http://www.w3.org/People/EM/contact#me	Eric Miller	mailto:em@w3.org
http://www.w3.org/People/karl/karl-foaf.xrdf#me	Karl Dubost	mailto:karl@w3.org
http://www.w3.org/People/Berners-Lee/card#cm	Coralie Mercier	mailto:coralie@w3.org
http://www.w3.org/People/Berners-Lee/card#dj	Dean Jackson	mailto:dean@w3.org
http://www.w3.org/People/Berners-Lee/card#dj	Dean Jackson	mailto:dino@grorg.org
http://www.w3.org/People/Berners-Lee/card#edd	Edd Dumbill	mailto:edd@usefulinc.com
http://www.w3.org/People/Berners-Lee/card#edd	Edd Dumbill	mailto:edd+xml.com
http://www.w3.org/People/Berners-Lee/card#edd	Edd Dumbill	mailto:edd+xmlhack.com
http://swordfish.rdfweb.org/people/libby/rdfweb/webwho.xrdf#me	Libby Miller	mailto:libby.miller@bristol.ac.uk
http://people.csail.mit.edu/lkagal/foaf.rdf#me	Lalana Kagal	mailto:lalana@csail.mit.edu
nodeID://1003907694	Susie Stephens	mailto:susie.stephens@gmail.com

Example 3 – traversing a graph

- Find the homepage of anyone known by Tim Berners-Lee

homepage
http://purl.org/net/eric/
http://www.johnseelybrown.com/
http://www.grorg.org/dean/
http://heddley.com/edd/
http://www.mellon.org/about_foundation/staff/program-area-staff/rafuchs

Example 3 – traversing a graph

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
PREFIX card: <http://www.w3.org/People/Berners-Lee/card#>
SELECT ?homepage
FROM <http://www.w3.org/People/Berners-Lee/card>
WHERE {
    card:i foaf:knows ?known .
    ?known foaf:homepage ?homepage .
}
```

- The FROM keyword specifies the target graph in the query
- By using ?known as an object of one triple and the subject of another, it is possible to traverse multiple links in the graph

Dataset: DBPedia

- DBPedia is an RDF version of information from Wikipedia
- Contains data derived from Wikipedia's infoboxes, category hierarchy, article abstracts, and various external links
- Contains over 100 million triples
- Dataset: <http://dbpedia.org/sparql/>

Example 4 – exploring DBPedia

- Find 15 example concepts in the DBPedia dataset

```
SELECT DISTINCT ?concept
WHERE {
    ?s a ?concept .
} LIMIT 15
```

concept
http://www.w3.org/2004/02/skos/core#Concept
http://dbpedia.org/ontology/MusicalWork
http://dbpedia.org/ontology/Resource
http://dbpedia.org/ontology/Work
http://dbpedia.org/ontology/Album
http://dbpedia.org/ontology/Musical
http://umbel.org/umbel/sc/Product
http://umbel.org/umbel/ac/Artifact
http://dbpedia.org/class/yago/1982Novels
http://dbpedia.org/ontology/Book
http://dbpedia.org/class/yago/EnglishAstronomers
http://dbpedia.org/class/yago/EnglishPoliticians
http://umbel.org/umbel/sc/Astronomer
http://dbpedia.org/class/yago/LivingPeople
http://dbpedia.org/class/yago/AmericanCompetitiveEaters

Example 4 – exploring DBPedia

- LIMIT is a **solution modifier** that limits the number of rows returned from a query
- SPARQL has two other solution modifiers
 - ORDER BY for **sorting** query solutions on the value of one or more variables
 - OFFSET, used in conjunction with LIMIT and ORDER BY to take a slice of a sorted solution set (e.g. for paging)
- The SPARQL keyword **a** is a shortcut for the common predicate **rdf:type** (class of a resource)
- The DISTINCT modifier **eliminates duplicate rows** from the query results

Example 5 – basic SPARQL filters

- Find all landlocked countries with a population greater than 15 million

```
PREFIX rdfs: <http://www.w3.org/2000/01/rdf-schema#>
PREFIX type: <http://dbpedia.org/class/yago/>
PREFIX prop: <http://dbpedia.org/property/>
SELECT ?country_name ?population
WHERE {
    ?country a type:LandlockedCountries ;
             rdfs:label ?country_name ;
             prop:populationEstimate ?population .
    FILTER (?population > 15000000) .
}
```

- FILTER constraints use boolean conditions to filter out unwanted query results
- A semicolon (;) can be used to separate two triple patterns that share the same subject

SPARQL filters

- Conditions on literal values
- Syntax

```
FILTER expression
```

- Examples

```
FILTER (?age > 30)  
FILTER isIRI(?x)  
FILTER !BOUND(?y)
```

SPARQL filters

■ `BOUND (var)`

- true if `var` is bound in query answer
- false, otherwise
- `!BOUND (var)` enables negation-as-failure

■ Testing types

- `isIRI (A)` : `A` is an “Internationalized Resource Identifier”
- `isBLANK (A)` : `A` is a blank node
- `isLITERAL (A)` : `A` is a literal

SPARQL filters

- Comparison between RDF terms

$A = B$
 $A \neq B$

- Comparison between Numeric and Date types

$A = B$
 $A \neq B$
 $A \leq B$
 $A \geq B$
 $A < B$
 $A > B$

- Boolean AND/OR

$A \ \&\& \ B$
 $A \ || \ B$

- Basic arithmetic

$A + B$
 $A - B$
 $A * B$
 A / B

Example 5 – basic SPARQL filters

- Note all the **translated duplicates** in the results
- How can we deal with that?

country_name	population
Afghanistan	31889923
Afghanistan	31889923
□□□□□□□	31889923
Afghanistan	31889923
Afghanistan	31889923
Афганистан	31889923
Afghanistan	31889923
Afganistán	31889923
Afganistan	31889923
Afghanistan	31889923
Afeganištāo	31889923
□□□	31889923
Afghanistan	31889923
Afghanistan	31889923
Afghanistan	31889923
Ethiopia	78254090
Éthiopie	78254090

Example 6 – SPARQL filters

- Find me all landlocked countries with a population greater than 15 million (revisited), with the highest population country first

```
PREFIX type: <http://dbpedia.org/class/yago/>
PREFIX prop: <http://dbpedia.org/property/>
SELECT ?country_name ?population
WHERE {
    ?country a type:LandlockedCountries ;
        rdfs:label ?country_name ;
        prop:populationEstimate ?population .
    FILTER (?population > 15000000 &&
        langMatches(lang(?country_name), "EN")) .
} ORDER BY DESC(?population)
```

Example 6 – SPARQL filters

- **lang** extracts a literal's language tag, if any
- **langMatches** matches a language tag against a language range

country_name	population
Ethiopia	78254090
Afghanistan	31889923
Uganda	30900000
Nepal	29519114
Uzbekistan	27372000
Kazakhstan	15217711

Dataset: Jamendo

- Jamendo is a community collection of music all freely licensed under Creative Commons licenses
 - <http://www.jamendo.com/it/>
- DBTune.org hosts a queryable RDF version of information about Jamendo's music collection
 - Data on thousands of artists, tens of thousands of albums, and nearly 100,000 tracks
 - <http://dbtune.org/jamendo/store/>

Example 7 – the wrong way

- Find all Jamendo artists along with their image, home page, and the location they're near

```
PREFIX mo: <http://purl.org/ontology/mo/>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name ?img ?hp ?loc
WHERE {
    ?a a mo:MusicArtist ;
        foaf:name ?name ;
        foaf:img ?img ;
        foaf:homepage ?hp ;
        foaf:based_near ?loc .
}
```

Example 7 – DBTune SPARQL endpoint

Interactive query

```
PREFIX mo: <http://purl.org/ontology/mo/>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name ?img ?hp ?loc
WHERE {
  ?a a mo:MusicArtist ;
    foaf:name ?name ;
    foaf:img ?img ;
    foaf:homepage ?hp ;
    foaf:based_near ?loc .
}
```

<http://dbtune.org/jamendo/store/>

Result format: Resource: Entailment:

- Jamendo has information on about 3,500 artists
- Trying the query we **only get 2,667** results. What's wrong?

Example 7 – the right way

- Not every artist has an image, homepage, or location!
- OPTIONAL tries to match a graph pattern, but **doesn't fail the whole query** if the optional match fails
- If an OPTIONAL pattern fails to match for a particular solution, any variables in that pattern remain **unbound** (no value) for that solution

```
PREFIX mo: <http://purl.org/ontology/mo/>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?name ?img ?hp ?loc
WHERE {
    ?a a mo:MusicArtist ;
        foaf:name ?name .
    OPTIONAL { ?a foaf:img ?img }
    OPTIONAL { ?a foaf:homepage ?hp }
    OPTIONAL { ?a foaf:based_near ?loc }
}
```

Dataset: GovTrack

- GovTrack provides SPARQL access to data on the U.S. Congress
- Contains over 13,000,000 triples about legislators, bills, and votes
- <http://www.govtrack.us/>

Example 8 – querying alternatives

- Find Senate bills that either John McCain or Barack Obama sponsored and the other cosponsored

```
PREFIX bill: <http://www.rdfabout.com/rdf/schema/usbill/>
PREFIX dc:   <http://purl.org/dc/elements/1.1/>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?title ?sponsor ?status
WHERE {
  { ?bill bill:sponsor ?mccain ; bill:cosponsor ?obama . }
    UNION
  { ?bill bill:sponsor ?obama ; bill:cosponsor ?mccain . }
  ?bill a bill:SenateBill ;
    bill:status ?status ;
    bill:sponsor ?sponsor ;
    dc:title ?title .
  ?obama foaf:name "Barack Obama" .
  ?mccain foaf:name "John McCain" .
}
```

Example 8 – GovTrack specific endpoint

```
PREFIX bill: <http://www.rdfabout.com/rdf/schema/usbill/>
PREFIX dc: <http://purl.org/dc/elements/1.1/>
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?title ?sponsor ?status
WHERE {
  { ?bill bill:sponsor ?mccain ; bill:cosponsor ?obama . }
  UNION
  { ?bill bill:sponsor ?obama ; bill:cosponsor ?mccain . }
```

Run Query

Display As: SPARQL XML

<http://www.govtrack.us/developers/rdf.xpd>

- The UNION keyword forms a **disjunction of two graph patterns**: solutions to both sides of the UNION are included in the results

RDF datasets

- All queries so far have been against a single graph
- In SPARQL this is known as the **default graph**
- RDF datasets are composed of a single default graph and **zero or more named graphs**, identified by a URI
- Named graphs can be specified with one or more **FROM NAMED clauses**, or they can be hardwired into a particular SPARQL endpoint
- The SPARQL **GRAPH keyword** allows portions of a query to match against the named graphs in the RDF dataset
- Anything outside a GRAPH clause matches against the default graph

Dataset: semanticweb.org

- data.semanticweb.org hosts RDF data regarding workshops, schedules, and presenters for the International Semantic Web (ISWC) and European Semantic Web Conference (ESWC) series of events
- Presents data via FOAF, SWRC, and iCal ontologies
- The data for each individual ISWC or ESWC event is stored in its own named graph
 - i.e., there is [one named graph per conference event](#) contained in this dataset
- <http://data.semanticweb.org/>

Example 9 – querying named graphs

- Find people who have been involved with at least three ISWC or ESWC conference events

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT DISTINCT ?person
WHERE {
    GRAPH ?g1 { ?person a foaf:Person }
    GRAPH ?g2 { ?person a foaf:Person }
    GRAPH ?g3 { ?person a foaf:Person }
    FILTER(?g1 != ?g2 && ?g1 != ?g3 && ?g2 != ?g3) .
}
```

Example 9 – querying named graphs

- The GRAPH ?g construct allows a pattern to match against **one of the named graphs** in the RDF dataset
- The URI of the matching graph is bound to ?g (or whatever variable was actually used)
- The FILTER assures that we're finding a person who occurs in three distinct graphs
- The Web interface used for this SPARQL query defines the foaf: prefix, which is why it is omitted here

Data.semanticweb.org specific SPARQL endpoint

<http://data.semanticweb.org/snorql/>

Snorql: Exploring <http://data.semanticweb.org/sparql>

GRAPH:Default graph. [List named graphs](#)

GRAPH:Named graph goes here. [Switch back to default graph](#)

SPARQL 1.1 extensions

■ Projected expressions

- Adds the ability for query results to contain values derived from constants, function calls, or other expressions in the SELECT list

■ Aggregates

- Adds the ability to group results and calculate aggregate values (e.g. count, min, max, avg, sum, ...)

■ Sub-queries

- Allows one query to be nested within another

SPARQL 1.1 extensions

■ Negation

- Includes improved language syntax for querying negations

■ Property paths

- Adds the ability to query arbitrarily length path through a graph via a regular-expression-like syntax known as property paths

■ Basic federated query

- Defines a mechanism for splitting a single query among multiple SPARQL endpoints and combining together the results from each

SPARQL exercise

Exercises - RDF

```
@prefix : <http://example.org/data#> .
@prefix ont: <http://example.org/myOntology#> .
@prefix vcard: <http://www.w3.org/2001/vcard-rdf/3.0#> .

:john
  vcard:FN "John Smith" ;
  vcard:N [
    vcard:Given "John" ;
    vcard:Family "Smith" ] ;
  ont:hasAge 32 ;
  ont:marriedTo :mary .
:mary
  vcard:FN "Mary Smith" ;
  vcard:N [
    vcard:Given "Mary" ;
    vcard:Family "Smith" ] ;
  ont:hasAge 29 .
```

SPARQL query – exercise 1

- Return the full names of all people in the graph

```
PREFIX vCard:  
<http://www.w3.org/2001/vcardrdf/3.0#>  
SELECT ?fullName  
WHERE {?x vCard:FN ?fullName}
```

- Result

```
fullName  
=====
```

"John Smith"
"Mary Smith"

SPARQL query – exercise 2

- Return the relation between John and Mary

```
PREFIX : <http://example.org/data#>
SELECT ?p
WHERE { :john ?p :mary }
```

- Result

```
p
=====
<http://example.org/myOntology#marriedTo>
```

SPARQL query – exercise 3

- Return the spouse of a person whose name is John Smith

```
PREFIX vCard:
<http://www.w3.org/2001/vcard-rdf/3.0#>
PREFIX ont: <http://example.org/myOntology#>
SELECT ?y
WHERE {?x vCard:FN "John Smith".
       ?x ont:marriedTo ?y}
```

- Result

```
y
=====
<http://example.org/data#mary>
```

SPARQL query – exercise 4

- Return the name and the first name of all people in the knowledge base

```
PREFIX vCard:
<http://www.w3.org/2001/vcard-rdf/3.0#>
SELECT ?name, ?firstName
WHERE {?x vCard:N ?name .
       ?name vCard:Given ?firstName}
```

■ Result

name	firstName
"John Smith"	"John"
"Mary Smith"	"Mary"

SPARQL query – exercise 5

- Return all people over 30 in the knowledge base

```
PREFIX ont: <http://example.org/myOntology#>
SELECT ?x
WHERE { ?x ont:hasAge ?age .
        FILTER(?age > 30) }
```

- Result

```
x
=====
<http://example.org/data#john>
```

FROM

- Select RDF graph (= dataset) to be queried
- In case of multiple FROM clauses, graphs are merged
- Example

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>  
SELECT ?name  
FROM <http://example.org/foaf/aliceFoaf>  
WHERE { ?x foaf:name ?name }
```

SPARQL query – exercise 6

■ Graph <http://example.org/bob>

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .  
_:a foaf:name "Bob" .  
_:a foaf:mbox <mailto:bob@oldcorp.example.org> .
```

■ Graph <http://example.org/alice>

```
@prefix foaf: <http://xmlns.com/foaf/0.1/> .  
_:a foaf:name "Alice" .  
_:a foaf:mbox <mailto:alice@work.example> .
```

SPARQL query – exercise 6

- Return the names of people in both graphs

```
PREFIX foaf: <http://xmlns.com/foaf/0.1/>
SELECT ?src ?name
FROM NAMED <http://example.org/alice>
FROM NAMED <http://example.org/bob>
WHERE
{ GRAPH ?src { ?x foaf:name ?name } }
```

■ Result

src	name
<http://example.org/bob>	"Bob"
<http://example.org/alice>	"Alice"
