Trustworthy Software Design with Alloy

In this project we are extending **Alloy** to make it a more **comprehensive** modelling tool for trustworthy software design.

One direction is to be able to quantify **faulty behaviour** in software models, in a **probabilistic** way.

We thought of extending Alloy's underlying Boolean matrices to **stochastic** matrices and of adapting the notion of **contract validity** accordingly.

This talk will present and discuss a **linear algebra** approach to "measuring" contract validity.

Relational composition:

- The Swiss army knife of Alloy
- It subsumes function application and "field selection"
- Encourages a **navigational** (point-free) style based on pattern *x*.(*R*.*S*).
- Example:

 $Person = \{(P1), (P2), (P3), (P4)\} \\ parent = \{(P1, P2), (P1, P3), (P2, P4)\} \\ me = \{(P1)\} \\ me.parent = \{(P2), (P3)\} \\ me.parent.parent = \{(P4)\} \\ Person.parent = \{(P2), (P3), (P4)\} \\ \end{cases}$

References

Alloy

Note how *me*, *me*.*parent* etc are all at most $Person < \stackrel{!^{\circ}}{-} 1$, where $!_{-} = 1$ (the everywhere-1 function).

Functions are Boolean matrices

A relation $B \stackrel{V}{\longleftarrow} A$ is said to be a **vector** if either A or B are the singleton type 1.

Relation $1 \stackrel{V}{\longleftarrow} A$ is said to be a **row**-vector; clearly, $V \subseteq !$

Relation $B \leftarrow 1$ is said to be a **column**-vector; clearly, $V \subseteq !^{\circ}$

Functions are Boolean matrices f such that

 $! \cdot f = ! \tag{1}$

for instance $\begin{bmatrix} 1 & 1 \end{bmatrix} \cdot \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 0 \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \end{bmatrix}$

NB: mind the two **polymorphic** copies of $!: A \rightarrow 1$ in (1).

Evolution

Alloy's "dot-join" $r \cdot s$ generalizes function composition

 $(f \cdot g) x = f (g x)$

to relation composition,

 $y(R \cdot S) x \Leftrightarrow \langle \exists z :: y R z \land z S x \rangle$

itself generalizable to matrix composition ("multiplication")

$$y (M \cdot N) x = \langle \sum z :: (y M z) \times (z N x) \rangle$$

where the infix y M z linking to relational notation is intentional.

In my view, any modelling tool should live peacefully with this function \rightarrow relation \rightarrow matrix evolution in expressiveness.

The evolution

Determinism (*functions*):

- Functional programming (FP)
- Imperative programming (if restricted)

Non-determinism (*relations*):

- Logic programming
- Relational modelling

Probabilism (*matrices*):

- Probabilistic modelling
- Quantum programming

References

Probabilistic functions

(2)

Probabilistic functions vs relations

Galois connection

 $\lfloor f \rfloor \subseteq R \Leftrightarrow f \leqslant \lceil R \rceil$

such that

 $\lfloor \lceil R \rceil \rfloor = R$

— that is, $[_]$ is **injective** and $[_]$ is **surjective**.

This enables us to regard the latter (supports) as a relational **abstract interpretation** of probabilistic functions (PF).

The preorder (\leq) ranks PFs according to (lack of) uniformity.

・ロト ・ 西ト ・ モト ・ モー ・ つへぐ

Monoidal categories

Every stage in the hierarchy forms a **monoidal category** whose **composition** has been given already, and whose **tensor** is based on **pairing**:

 $M \otimes N = (M \cdot fst) \lor (N \cdot snd)$ (3)

Pairing is a weak product for PFs:

$$k = M \lor N \Rightarrow \begin{cases} fst \cdot k = M \\ snd \cdot k = N \end{cases}$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

For **pure** functions this becomes a **full** categorial product.

Probabilistic pairing (Khatri-Rao)

In summary: weak product still grants the cancellation rule,

 $fst \cdot (M \lor N) = M \land snd \cdot (M \lor N) = N$

cf. e.g.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Probabilistic pairing (entanglement)

... but reconstruction

 $X = (fst \cdot X) \lor (snd \cdot X)$

doesn't hold in general, cf. e.g.

 $X : 2 \to 2 \times 3$ $X = \begin{bmatrix} 0 & 0.4 \\ 0.2 & 0 \\ 0.2 & 0.1 \\ 0.6 & 0.4 \\ 0 & 0 \\ 0 & 0.1 \end{bmatrix} \quad (fst \cdot X) \lor (snd \cdot X) = \begin{bmatrix} 0.24 & 0.4 \\ 0.08 & 0 \\ 0.08 & 0.1 \\ 0.36 & 0.4 \\ 0.12 & 0 \\ 0.12 & 0.1 \end{bmatrix}$

X is not recoverable from its projections: Khatri-Rao not surjective.

(**Entangled** distributions on pairs **fall outside** the range of the Khatri-Rao product.)

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Bayesian network (probabilistic model)

		G	S	R	
$G \times (S \times R) \stackrel{state}{\leftarrow} 1$	=	dry	off	no	0.4800
				yes	0.0396
			on	no	0.0320
				yes	0.0000
		wet	off	no	0.0000
				yes	0.1584
			on	no	0.2880
				yes	0.0020

Moreover, we can define

$$1 \xleftarrow{\text{grass_wet}} G \times (S \times R) = [0 \ 1] \cdot \text{fst}$$
$$1 \xleftarrow{\text{raining}} G \times (S \times R) = [0 \ 1] \cdot \text{snd} \cdot \text{snd}$$

etc. to obtain e.g. $P_{state}(grass_wet) = grass_wet \cdot state = 44.84\%$.

References

Bayesian network querying

Conditional probabilities over state distribution δ :

$$P_{\delta}(a \mid b) = \frac{(a \times b) \cdot \delta}{b \cdot \delta} \quad \text{where} \quad 1 \stackrel{a,b}{\longleftarrow} S \stackrel{\delta}{\longleftarrow} 1 \tag{4}$$

Boolean vectors **a** and **b** describe **event** sets.

Recall

Forwards: $P_{\delta}(grass_wet \mid raining) = 80.19\%$

Backwards: $P_{\delta}(raining \mid grass_wet) = 35.77\%$

By the way

Bayes theorem:

 $P(a \mid b) = P(b \mid a) \frac{P(a)}{P(b)}$

cf. (assuming $\delta: 1 \rightarrow S$):

$$\mathrm{P}_{\delta}(\mathsf{a} \mid \mathsf{b}) = \mathrm{P}_{\delta}(\mathsf{b} \mid \mathsf{a}) \; rac{\mathrm{P}_{\delta}(\mathsf{a})}{\mathrm{P}_{\delta}(\mathsf{b})}$$

 $\Leftrightarrow \qquad \{ \text{ trivial } \}$

 $\mathrm{P}_{\delta}(\mathsf{a} \mid \mathsf{b}) \mathrm{P}_{\delta}(\mathsf{b}) = \mathrm{P}_{\delta}(\mathsf{b} \mid \mathsf{a}) \mathrm{P}_{\delta}(\mathsf{a})$

 $\Leftrightarrow \qquad \{ (4) \text{ twice } \}$

$$(a \times b) \cdot \delta = (b \times a) \cdot \delta$$

(5)

Towards probabilistic contracts

 $P_{\delta}(raining | grass_wet) = 35.77\% - backwards reasoning - is suggestive of (weakest)$ **precondition**validation - in a sense, it tells how important raining is as**cause**for the grass to be wet (effect).

Note that probabilistic function

 $f: R \to S \times G$ $f = (fst \lor grass) \cdot (sprinkler \lor id)$

that is,

			no	yes
<i>f</i> =	off	dry	0.6	0.198
		wet	0	0.792
	on	dry	0.04	0.010
		wet	0.36	0.001

describes a system that reacts to raining.

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Towards probabilistic contracts

In what sense — measure? — can we say that some f satisfies the contract

 $grass_wet \xleftarrow{f} raining$ (6)

and what does (6) mean?

Back to **pure** function $f : Y \leftarrow X$:

$$q \xleftarrow{f} p \Leftrightarrow \langle \forall x : x \in X : p x \Rightarrow q (f x) \rangle$$

or, if you wish,

$$q \xleftarrow{f} p \iff \neg \langle \exists x : x \in X : p x \land \neg q (f x) \rangle$$

Towards probabilistic contracts

That is, model checking $q \leftarrow p$ means finding those $x \in X$ that violate the contract.

In a probabilistic setting, such $x \in X$ are captured by a **distribution** vector $\delta : 1 \to X$.

Term q(f x) will then correspond to scalar $1 \stackrel{q \cdot f \cdot \delta}{\longleftarrow} 1$ — a **probability**.

But first we have to regard f as a (kind of) **probabilistic relation**, as in the Bayesian network above.

That is, we need to have access to the I/O behaviour of f.

Towards probabilistic contracts

Recall that a **probabilistic** function $f : A \to B$ (PF) is half way between **pure** functions and **relations**: $! \cdot f = !$ holds and their support $\lfloor f \rfloor$ is a relation of the same type $A \to B$.

Below we will take PF

This support (a relation) can be mapped back to the PF

as example, with support

$$\lfloor f \rfloor = \frac{\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & 1 & 1 & 1 \\ b_2 & 1 & 1 & 0 \end{vmatrix}$$

Towards probabilistic contracts

The I/O behaviour of f knowing the distribution δ of the inputs is given by γ in

 $B \times A \stackrel{f^{\nabla} id}{\leftarrow} A$

Example (*f* as before):

$$\delta = \begin{array}{c|c} A \\ \hline a_1 & 0.1 \\ a_2 & 0.2 \\ a_3 & 0.7 \end{array}$$

Then

	B imes A	
	(b_1, a_1)	0.070
	(b_1, a_2)	0.002
$\gamma =$	(b_1, a_3)	0.700
	(b_2, a_1)	0.030
	(b_2, a_2)	0.198
	(b_2, a_3)	0

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Measuring probabilistic contracts

Let us define:

$$\llbracket q \stackrel{f}{\longleftarrow} p \rrbracket_{\delta} = P_{\gamma}(q \cdot fst \mid p \cdot snd)$$
(7)

where $\gamma = (f \circ id) \cdot \delta$ — check the diagram below:

In the next slide we show that (7) simplifies to

$$\llbracket q \stackrel{f}{\longleftarrow} p \rrbracket_{\delta} = (q \cdot f \times p) \cdot \frac{\delta}{p \cdot \delta} \quad (8)$$

where \times is the Hadamard product.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ○□ のへで

(ロ)、

Measuring probabilistic contracts

$$\begin{bmatrix} q < \frac{f}{p} \end{bmatrix}_{\delta} \\ = \begin{cases} \text{ definition (7) } \\ P_{(f^{\nabla} id) \cdot \delta}(q \cdot fst \mid p \cdot snd) \\ = \\ \{ \text{ definitions (4) and (13); } snd \cdot (f^{\nabla} id) = id \end{cases} \} \\ \frac{(q \bowtie p) \cdot (f^{\nabla} id) \cdot \delta}{p \cdot \delta} \\ = \\ \{ (12) \} \\ (q \cdot f \times p) \cdot \frac{\delta}{p \cdot \delta} \\ \end{bmatrix}$$
Case $p = true$ simplifies to $\llbracket q < \frac{f}{p} \cdot true \rrbracket_{\delta} = q \cdot f \cdot \delta.$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Measuring probabilistic contracts

Going pointwise:

$$\llbracket q \prec \frac{f}{\sqrt{p}} p \rrbracket_{\delta} = \frac{\langle \sum b, a : q b \land p a : (b f a) (\delta a) \rangle}{\langle \sum a : p a : \delta a \rangle}$$

Useful LA properties:

$$(M \circ N)^{\circ} \cdot (P \circ Q) = (M^{\circ} \cdot P) \times (N^{\circ} \cdot Q)$$
(9)

$$(P \bowtie Q)^{\circ} = P^{\circ} \nabla Q^{\circ}$$
(10)

$$(M \bowtie N) \cdot (P \otimes Q) = M \cdot P \bowtie N \cdot Q \tag{11}$$

$$(P \bowtie Q) \cdot (F \triangledown G) = (P \cdot F) \times (Q \cdot G)$$
(12)

$$P \bowtie Q = (P \cdot fst) \times (Q \cdot snd)$$
(13)

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Measuring probabilistic contracts

Example, recalling

Then, for instance,

$$\{b_2\} \xleftarrow{f} \{a_1, a_2\} = 76\%$$

$$\{b_2\} \xleftarrow{f} \{a_3\} = 0\%$$

$$\{b_2\} \xleftarrow{f} true = 22.8\%$$

$$true \xleftarrow{f} \{a_1, a_2\} = 100\%$$

etc

Model checking probabilistic contracts

```
In Alloy, given
```

```
assert contract { all a:A | p[a] => q[a.f] }
```

by executing

```
check contract for ... A
```

the tool will try and find a such that $p a \land \neg q (f a)$ holds.

Now let f be **probabilistic**. In the future one may imagine submitting something like

```
check contract >= 80% for ... A
```

hoping the tool cannot find δ such that $[\![q \leftarrow p]\!]_{\delta} < 0.8.$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Towards a Probabilistic Alloy

Under the finite scope assumption, this boils down to solving classical systems of inequations:

$$\begin{bmatrix} p \xleftarrow{f} q \end{bmatrix}_{\delta} < k$$

$$\Leftrightarrow \qquad \{ \text{ recall } q \bowtie p = (q \cdot fst) \times (p \cdot snd) \text{ (13) } \}$$

$$\frac{(q \bowtie p) \cdot (f \lor id) \cdot \delta}{p \cdot \delta} < k$$

$$\Leftrightarrow \qquad \{ \text{ as before, re-arranging } \}$$

$$\langle \sum b, a : q b \land p a : (b f a) (\delta a) \rangle < \langle \sum a : p a : k \delta a \rangle$$

Example: find δ such that $\llbracket \{b_2\} \stackrel{f}{\longleftarrow} \{a_1, a_2\} \rrbracket_{\delta} < 0.8$ (next slide):

Towards a Probabilistic Alloy

▲□▶ ▲圖▶ ★ 臣▶ ★ 臣▶ = 臣 = の Q @

How I have worked thus far...

"Oldie but goodie"

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Calculating probabilistic contracts

I didn't make a full sanity check of contract validity yet, but some expected **laws** are easy to check, cf. e.g.

$$\begin{bmatrix} true \leftarrow f \\ p \end{bmatrix}_{\delta}$$

$$= \{ \text{ unfold definition, } true = \top (1 \text{s everywhere}) \}$$

$$\frac{(\top \times p \cdot \text{snd}) \cdot (f \lor id) \cdot \delta}{p \cdot \delta}$$

$$= \{ \text{ Hadamard product: } \top \times M = M, \text{ snd} \cdot (f \lor id) = id \}$$

$$\frac{p \cdot \delta}{p \cdot \delta}$$

$$= \{ \text{ trivia} \}$$

$$1$$

Calculating probabilistic contracts

But note that

$$\llbracket p \prec \overset{g}{\longleftarrow} \text{false} \rrbracket_{\delta} = \frac{(p \cdot \text{fst} \times \bot \cdot \text{snd}) \cdot (g \lor \text{id}) \cdot \delta}{\bot \cdot \delta} = \frac{0}{0}$$

is mathematically undetermined...

Now let us have a look at the **sequence** $q < \frac{f \cdot g}{r}$ r of two contracts $q < \frac{f}{r}$ p and $p < \frac{g}{r}$ r.

To begin with, let us handle the special case $q < \frac{f}{true}$ and $p < \frac{g}{true}$. We calculate (next slide):

Calculating probabilistic contracts

$$[\![p \prec g^{g} true]\!]_{\delta} \leq 1$$

$$(q \cdot f \cdot g \cdot \delta) \times \llbracket p \xleftarrow{s} true \rrbracket_{\delta} \leq q \cdot f \cdot g \cdot \delta$$

 $\Leftrightarrow \qquad \left\{ \text{ associativity } \right\}$

 \Rightarrow

$$(q \cdot f \cdot (g \cdot \delta)) \times \llbracket p \stackrel{g}{\longleftarrow} true \rrbracket_{\delta} \leqslant q \cdot (f \cdot g) \cdot \delta$$

 $\Leftrightarrow \qquad \{ \text{ definition (twice) } \}$

$$\llbracket q \xleftarrow{f} true \rrbracket_{g \cdot \delta} \times \llbracket p \xleftarrow{g} true \rrbracket_{\delta} \leqslant \llbracket q \xleftarrow{f \cdot g} true \rrbracket_{\delta}$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Calculating probabilistic contracts

This suggests the generic inference rule:

$$\llbracket q \stackrel{f}{\longleftarrow} p \rrbracket_{g \cdot \delta} \times \llbracket p \stackrel{g}{\longleftarrow} r \rrbracket_{\delta} \leqslant \llbracket q \stackrel{f \cdot g}{\longleftarrow} r \rrbracket_{\delta}$$

Example: *f* is as before and

We have $\{a_1, a_2\} \xleftarrow{g} \{c_2, c_3\} = 22\%$ for such δ .

Calculating probabilistic contracts

Because f receives outputs from g, the distribution of its inputs will be

$$g \cdot \delta = \begin{array}{c} & \\ a_1 & 0.08 \\ a_2 & 0.16 \\ a_3 & 0.76 \end{array}$$

Т

We measure $\{b_2\} \leftarrow \{a_1, a_2\} = 76\%$ for $g \cdot \delta$, the same by coincidence.

So the joint probability of both contracts holding is

$$\begin{bmatrix} \{ b_2 \} \prec f \\ \{ a_1, a_2 \} \end{bmatrix}_{g \cdot \delta} \times \begin{bmatrix} \{ a_1, a_2 \} \prec f \\ \{ a_1, a_2 \} \prec f \\ \{ c_2, c_3 \} \end{bmatrix}_{\delta}$$

$$= 0.22 \times 0.76$$

$$= 16.72\%$$

This is smaller than the probability of the composite contract holding: $[\![\{ b_2 \} \stackrel{f \cdot g}{\longleftarrow} \{ c_2, c_3 \}]\!]_{\delta} = 18.93\%.$

Calculating probabilistic contracts

However, this rule does not always hold (!), as the following counter-example shows:

This recalls a similar problem identified long ago by McIver and Morgan (2005): *probabilistic* **Hoare triples** *not compositional* in general...

But our setting here is simpler (e.g. no demonic choice).

Current work

Currently checking this and other rules (calculating side conditions).

Further to (McIver and Morgan, 2005), there is recent work in the literature about **conditioning** in probabilistic programming, see e.g. (Gretz et al., 2015), which can be of help.

Also algorithms that use ideas from program analysis in probabilistic programming, see e.g. (Nori et al., 2014).

Carroll's suggestion at the meeting: McIver et al. (2008)

Pobabilistic contracts

References

Afterthought

Recall matrix supports.

Can the current Alloy relational engine help in finding the counter-example **distributions**, as a kind of Al?

 $f = \lfloor - \rfloor, g = \lceil - \rceil$ etc.
